

How to View Server Logs for Whop Authentication Debugging

Production Logs (Vercel)

1. Via Vercel Dashboard:

- Go to: <https://vercel.com/dashboard>
- Select your `barrels_pwa` project
- Click "Logs" or "Functions" → "Logs"
- Filter by time: "Last 15 minutes"
- Search for: `[Login Page]` or `[Whop Auth]`

2. Via Vercel CLI:

```
bash
vercel logs catchbarrels.app --follow
```

What to Look For

Successful Flow:

```
[Login Page] Starting login page load...
[Login Page] Whop detection: { hasWhopToken: true, hasWhopReferer: true }
[Login Page] Detected Whop iframe request, attempting automatic authentication...
[Login Page] Step 1: Verifying Whop token...
[Whop Auth] Token present: true
[Whop Auth] Validation result: { userId: "...", appId: "..."}
[Login Page] Step 2: Checking Whop access...
[Login Page] Step 3: Finding or creating user...
[Login Page] Step 4: Syncing Whop membership...
[Login Page] Step 5: Redirecting...
[Login Page] Redirecting to dashboard
```

Failed Authentication:

```
[Login Page] Starting login page load...
[Login Page] Whop detection: { hasWhopToken: true, hasWhopReferer: true }
[Login Page] Detected Whop iframe request, attempting automatic authentication...
[Login Page] Step 1: Verifying Whop token...
[Whop Auth] Token present: true
[Whop Auth] Token validation failed: [ERROR MESSAGE HERE]
[Login Page] Whop authentication error: [ERROR DETAILS]
```

Failed Access Check:

```
[Login Page] Step 1: Verifying Whop token...
[Whop Auth] Token present: true
[Whop Auth] Validation result: { userId: '...', appId: '...' }
[Login Page] Step 2: Checking Whop access...
[Whop Auth] Checking access for userId=... experience=default
[Whop Auth] Fetching memberships from Whop API...
[Whop Auth] Memberships API returned: { data: [] }
[Whop Auth] No valid membership found
[Login Page] Access check failed
```

Key Error Patterns

1. **“Token validation failed”** → Issue with WHOP_API_KEY or token format
2. **“No valid membership found”** → User doesn’t have active subscription
3. **“User creation failed”** → Database/Prisma error
4. **“Membership sync failed”** → Whop API connection issue

Common Issues & Quick Fixes

Issue 1: “No valid membership found”

Cause: User account in Whop doesn’t have an active CatchBarrels subscription

Fix:

1. Go to Whop Business Dashboard
2. Verify the test account has an active subscription
3. Try with a different Whop account that has a subscription

Issue 2: “Token validation failed”

Cause: WHOP_API_KEY or WHOP_APP_ID mismatch

Fix:

1. Verify environment variables are correct in production
2. Check Whop Developer Dashboard for correct API key
3. Redeploy if env vars were updated

Issue 3: “User creation failed”

Cause: Database connection issue or Prisma error

Fix:

1. Check DATABASE_URL is correct in production
2. Verify Prisma schema is migrated
3. Check database connection logs

Next Steps

Based on the error pattern, send me:

- The exact error message from logs
- The log entries with timestamps
- Which step is failing (Step 1, 2, 3, 4, or 5)
- Your Whop account email (to verify subscription status)
